

TrainRekt

Get rekt in training. Not on-chain.

Interactive crypto decision & wallet-safety training for Solana Mobile

Built for the real decisions users face before real money is at risk.

Pascal Schaer • Solana Mobile CLOCK IN Hackathon • 2026

The Problem

Crypto is easy to enter. Safe decision-making is much harder.

High-stakes decisions

Users face signatures, permissions, suspicious airdrops, leverage, position sizing and wallet activity—often before they understand the consequences.

Learning is expensive

A bad decision on-chain can cost real assets. Traditional educational content explains concepts, but rarely lets users practise the decision itself.

Security is contextual

The same technical signal can deserve attention without automatically meaning “scam”. Users need judgement, not simplistic green/red labels.

The Solution: TrainRekt

Learn by deciding, not only by reading.

Real Solana Mobile Integration

Real wallet context. Simulated high-risk actions.

REAL

- Solana Mobile Wallet Adapter authorization / connection
- Public wallet identity
- Read-only Solana RPC inspection
- SPL Token + Token-2022 account analysis
- Wallet-connected training context

SIMULATED / SAFETY-BOUND

- Signature decisions
- Transaction approval decisions
- Permission decisions
- Surprise Security Challenges
- No real asset transaction submission
- Real message signing disabled

Standalone signed Android release physically smoke-tested on a Solana Seeker.

Learn From Your Wallet

Personalized security training from real read-only wallet signals.

Technical signals are educational review signals—not automatic scam or safety verdicts.

Built for Safety

The training environment is deliberately separated from asset-moving actions.

No key custody

TrainRekt does not handle seed phrases or private keys in app business logic.

Read-only inspection

Wallet Safety uses public Solana/RPC information for educational analysis without submitting asset transactions.

Explicit boundaries

Training approvals and signatures are simulated. Sensitive MWA authorization data is kept in memory; local disconnect clears app wallet state.

Architecture: routes/screens → components → hooks/context → domain → services/storage

The Builder — Pascal Schaer

Software Developer · .NET · Angular · Solana / Web3

I have spent more than 10 years building software professionally.

I wanted to combine that experience with my interest in crypto and take a serious step into Web3 and Solana development. Instead of waiting for an opportunity, I decided to create one.

TrainRekt is the result: from idea to a working Solana Mobile application running on a real Seeker.

Core experience

10+ years software development

C# / .NET

Angular / TypeScript

Software architecture

Solana / Web3

AI-assisted development

Open to opportunities in Software Engineering, Web3 and Solana.

Train Before It Costs You.

Train → Connect → Inspect → Learn → Improve

TrainRekt turns real crypto decision patterns and read-only wallet context into practical training—without telling users what to buy and without putting real assets at risk.
